## Normal Distribution

## What can we do with this?

If the normal distribution is a good approximation, then we can use the math of the probability density to answer questions about the data:

- Probability of ranges
- Relative probability

## Data Standardization

If your data is approximately normal, a useful way to describe a value is by how many standard deviations it is from the mean

- " 0.5 standard deviations below average"
- " 2.2 standard deviations above average"

## Data Standardization

$$
Z(x)=\frac{x-\mu}{\sigma}
$$

- Called the "Z-score"
- If $Z(x)$ is negative, $x$ is to the left of the mean.
- If $Z(x)=0, x$ is the mean.
- If $Z(x)$ is positive, $x$ is to the right of the mean.
- The absolute value of $Z(x)$ is the number of standard deviations $x$ is above or below the mean.

## Data Standardization

Z-scores allow you to compare data values that are on different scales

- The normal distribution of the SAT is given by $N(1500,300)$, while the normal distribution of the ACT is given by $N(21,5)$.
- Ann gets an 1800 on the SAT, while Tom gets a 24 on the ACT. Which student did better on the college entrance exam?
- Compare their Z-scores

## Data Standardization

Z-scores allow you to compare data values that are on different scales

## Percentiles and Ranges

The normal distribution can tell you the probability that data falls within a certain range

- If you convert your data to Z-scores, you can look up the probabilities of ranges for a standard normal

## Normal Probability Table

A standard normal probability table can tell you the percentile of a given Z-score

- That is: what \% of data is below a certain Z-score
- This corresponds to the area under the normal curve

## Normal Probability Table

- Appendix B. 1

| 1.1 | 0.8643 | 0.8665 | 0.8686 | 0.8708 | 0.8729 | 0.8749 | 0.8770 | 0.8790 | 0.8810 | 0.8830 |  |
| $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ |  |

Table 3.8: A section of the normal probability table. The percentile for a normal random variable with $Z=0.43$ has been highlighted, and the percentile closest to 0.8000 has also been highlighted.

## Normal Probability Table

Special case: Z-score of 0 is the 50th percentile
(Remember: 50th percentile is the same as the median. Because normal distributions are symmetric, the mean and median are the same.)

## Percentiles and Ranges

Use the normal probability table to answer questions about percentiles and the probability of a range of values (after converting to $z$-scores)

- The normal distribution of the SAT is given by $N(1500,300)$, while the normal distribution of the ACT is given by $N(21,5)$.
- Ann gets an 1800 on the SAT, while Tom gets a 24 on the ACT. What is Ann's percentile? What is Tom's percentile?

## Percentiles and Ranges

The percentiles from the table tell you the probability that data is below the value

- Need to do some arithmetic if you want the probability above a value or between two values

## Percentiles and Ranges

The percentiles from the table tell you the probability that data is below the value

- Need to do some arithmetic if you want the probability above a value or between two values

$$
1.0000-0.3821-0.1131=0.5048
$$

## Percentiles and Ranges

Head lengths of brushtail possums follow a nearly normal distribution with mean 92.6 mm and standard deviation 3.6 mm .

What is the probability that a randomly selected possum has a head length larger than 93mm? Larger than 100 ?
Larger than $110 ?$

## Percentiles and Ranges

What percentage of data is within 1 standard deviation of the mean?

Within 2 standard deviations?

Within 3 standard deviations?

## 68-95-99 rule
